P. P.	(STRD ) UNIV LELAND STANFORD JUNIOR. Clayberger C, Krensky AM:
DR	WPI; 95-194027/25.
ΡŢ	Compsns. comprising lymphoid surface membrane proteins - which may
PT	inhibit cytolytic activity and differentiation of CTLs.
ນ ເ	Example; Page 12; 29pp; English. R95413. and R95415-R95431 represent palindromes and fragments of
ខ	human-leucocyte-associated antidens. This sequence represents the
ပ္ပ	HLA-B2702 84-75-84 palindrome. These sequences can be used to isolate
ပ္ပ	the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane
ပ္ပင္ပ	protein associated with T-cell activation in mammalian T-cells, and is
35	also immunologically cross reactive with the heat shock protein Asc/U.
88	expressed on B and T cells. p74 can be isolated by lysis of a suitable
ပ္ပ	cell with an amphoteric detergent, and then passed through an affinity
႘	column containing a covalently bound HIA-B2702 palindromic peptide.
ပ္ပင္ပ	Compositions comprising the extracellular fragment of p74 combined with HTA-B2702.60-84 (see R95416), induces calcium influx, and inhihits
ខ	cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate
ပ္ပ	compounds can be screened for their effect on the cytolytic activity of
ပ္ပ	T-cells, by combining them with the extracellular portion of p74 and
ខ្ល	determining the amount of binding between the candidate compound and p74.
36	Modulation of the activity can be innibited in a celiular composition
ນບ	containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of b74. In an amount sufficient to compete
ខ	with p74 for the binding of the p74 ligand.

Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16-MAY-1996 (first entry)

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of a coeptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime modulate for unhibit) the activity of the cytotoxic T lymphocytes (CTLS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R82913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of
                                                                                                                                                                                                                                                                          16-WAY-1996 (first entry)

HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).

Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparated to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R95430;

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                           HLA-B2702 CTL modulating peptide (B2702.84-75).

Thibit cytolytic activity and differentiation of CTLS.

Example; Page 11; 29pp; English.

This sequence represents the alphal-helix of the chunan-leucocyte-associated antigen B2702 (HLA-B2702). This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cells, and is a look of the protein p74 from a T-cell lysate. p74 is a T-cells, and is a look of the protein associated with T-cell activation in mammalian T-cells, and is a look of the protein associated with T-cell solutive with the heat shock protein HSC70.

Expressed on B and T cells. p74 can be isolated by lysis of a suitable compositions comperising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the containing T-cells and antigen presenting cells (APCS), by adding to the containing the binding of the p74 in an amount sufficient to compete containing the mach and p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient to compete the p74 in an amount sufficient to compete containing the protein p74 in an amount sufficient protein protein protein protein protein protein protein protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-NOV-1996 (first entry)
Alphal-helix of HLA-B2702.
Alphal-helix, alphal-helix, human-leucocyte-associated antigen; inhibitor;
T-cell lysate; membrane protein; mammal; heat shock protein; Hsc70; APC;
B cell; calcium influx; cytotoxic I lymphocyte; CTL; differentiation;
acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of mine (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70.84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-MXY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.70-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                               New peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets claim 11; Page 54; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
Peptide fragment of Class I HLA peptide.
Human leukocyte antigen; HLA; peptide; transplantation; neoplasia;
parasitic disease; cytotoxic T lymphocyte; modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Extension of acceptance period of transplants from MHC unmatched donor hosts – using Class I B75-84 MHC antigen of the recipient

New peptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Claim 8; Page 53; 61pp; English.
The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL coxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of Colass I major histocompatibility complex (MRC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HLAB38. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLAB38.

Gene J protein makes up the distal fiber of the phage tail. It is
responsible for adsorption to the host during infection and
determines host specificity. It specifically binds to the lambda
receptor protein of E. coil file. This receptor protein encoded by
E. coll gene lamb is an outer membrane protein that functions in
the transport of maltose and maltodextrins.

DAMENT Under the action of the gene G, T, H, M, L, K, and I proteins, gene
J protein serves as the initiator of tail polymerization. There
are 2-4 copies of protein J per mature phage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AD / U96 #type complete nudel protein precursor - fruit fly (Drosophila melanogaster) #formal_name Drosophila melanogaster 27-oct-1995 #sequence_revision 27-oct-1995 #text_change AS7096 AS7096

##cross-references DDBJ:D78001

This enzyme belongs to alpha-amylase family. It catalyzes the
conversation of maltodextrins to maltocligosyl trehaloses by
forming alpha,alpha-1,1-glucosidic linkage by an intramolecular
transglucosylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T.; Kurimoto, M. Blochem. (1996) 60:717-720 Elocation and sequencing of trehalose biosynthesis genes from Rhizobium sp. M-11.

COMPLEX THAT IS EXPRESSED ON THE SURFACE OF PRE-B-CELLS. THIS COMPLEX PRESUMABLY REGULARES OF PRE-B-CELLS.

COMPLEX PRESUMABLY REGULATES IG GENE REARRANGEMENTS IN THE EARLY STEPS OF B-CELL DIFFERENTIATION.

C-1- TISSUE SPECIFICITY: ONLY EXPRESSED BY PRE-B-CELLS.

C-1- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY.

83016-1883065, R83096 and R82207-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIAA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/84-75).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human-leucocyte-associated antigens. This sequence represents the HLA-B2702 84-751/75-84T palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell sufface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of a coeptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                          HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).

                                                         Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities sample 2, Page 67-68; 146pp; English.

RR742-R87144 represent partial fragments of the drosophila protocadherin sequence. The cDNAs encoding these sequences were isolated after sequence. The cDNAs encoding these sequences were isolated after consequences of the third and fourth extracellular domains of the amino acid sequences of the third and fourth extracellular domains of the canno acid sequences of the third and fourth extracellular domains of the interacts with the cytoskeleton through catenins and other cytoskeleton associated proteins. The cytoplasmic domain of cadherins adhesive function. The cadherins and ont possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cell-cell adhesion. These sequences may have regulatory functions in the cell. These protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

R59496-R61666 are immunogenic 10mer peptides that contain a HIA-A2.1 binding motif. These peptides bind HIA-A2.1 and have a binding affairty of at least 1% as compared to a reference peptide (R71293). R61548 has an 1050 of 0.0036 and the sequence occurs at position 24 in the HPV E6 protein. The peptides of the invention can induce cytocoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hydr-1995 (first entry)

PT Composits of Imphoid surface membrane proteins - which may composits comprising lyaphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example; Page 12; 29pp; English.

Example; Page 12; 29pp; English.

CC R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the HA-B2702 84-79-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane communion associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein R970.

CC protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein R970.

CC protein associated mumber of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable coll with an amphoteric detergent, and then passed through an affinity expressed on B and T cells. p74 can be isolated by lysis of a suitable coll with an amphoteric detergent, and then passed through an affinity coll with a suit of the sextracellular fragment of p74 combined with the extracellular portion of cri activity can be inhibited in a cellular composition of containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.

Sequence 12 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R95428;

Naturation actual binding and regulating activities.

Polynucleotide sequences encoding new proto:cadherins - useful
For modulating natural binding and regulating activities.

Example; Page 63; 114pp; English.

Two regions of conserved AA sequence, one from the middle of the curth extracellular subdomain (EC-3) and the other from the chiral cadherin extracellular subdomain (EC-4) were designed for use as PCR primers. PCR was carried out on a rat brain conversion of the fourth extracellular subdomain (EC-4) were designed for use as PCR primers. PCR was carried out on a rat brain conversion of the previously identified about 450 bps and 130 bps were found.

The 450 bp band corresponded to the expected length between the two primer sites, but the 130 bp band could not be predicted from any coff the previously identified cadherin sequences. The 450 bp and 130 bp band could not be predicted from any coff the previously identified cadherin sequences. The 450 bp and 130 bp band sequences. Or the PCR primers of the Clones were isolated. The DNA and deduced AA sequences of the resulting PCR fragments structurally similar to the rat cDNAs were isolated from human, mouse and Xenopus brain cDNA prepns. By PCR using the above primers.

Cholouds whole body cDNA prepns. by PCR using the above primers.

Che bnA and deduced AA sequences of the resulting PCR fragments (including sequences corresp. to the PCR primers) are given in preparation of the deduced AA sequences indicates a similarity, in particular, there are three sets of clones that appear to be cross-species homologues: RAT-218, MOUSE-325 and HUMAN-43; RAT-314, MOUSE-321 and HUMAN-11; and MOUSE-326 and HUMAN-42. ö Length 43; 0; Indels Score 46; DB 11; I Pred. ### ALIGNMENTS

```
copions compositions competed to the extracellular flux. This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein prof from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell lysate. P74 is a T-cells, and is also immunologically cross reactive with the heat shock protein and is also immunologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity compositions comprising the extracellular fragment of F74 combined with HzA-B2702.60-84 (see R95416), induces calcum influx, and inhibits compositions comprising the extracellular fragment of F74 combined with HzA-B2702.60-84 (see R95416), induces calcum influx, and inhibits compositions and be screened for their effect on the cytolytic activity of T-cells, by combining the mount of binding between the candidate compound and F74. Modulation of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition of CTL activity can be inhibited in a cellular composition with the extracellular portion of F74, in an amount sufficient to compete with F74 for the binding of the F74 ligand.
                                                                12-NOV-1996 (first entry)

HLA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of The peptides are administered to a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the pifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILs
                                              Mew peptide(s) based on class I HLA antigen domains - used for modulating cytocxic T-lymphocyte activity towards targets claim 11; Page 54; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R83094 standard; peptide; 10 AA.

Composins. comprising lymphoid surface membrane proteins - which may finhibit cytolytic activity and differentiation of CTLS.

Frample: Page 11: 29pp: English.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the H1A-B2702.75-84(D). These sequences can be used to isolate the protein of sociated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly expressed on English and teargent, and then passed through an affinity column corrected extracellular fragment of P74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compounds can be screened for their effect on the cytolytic activity of compounds can be screened for their effect on the cytolytic activity of determining the amount of binding between the candidate compound and P74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of P74, in an amount sufficient to compete containing T-cells and antigen presenting cells (APCS), by adding to the seminance of the p74 ligand.
                                                                                                                                                              12-NOV-1996 (first entry)

                                                                                                                                                                                                                                                         R83061-R83085, R83090-R8309 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the petide for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-NOV'1996 (first entry)

R83061-R83085, R83090, R831096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly
containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand. Sequence 12 AA;

R83061-R83085, R83090-R83096 and R92807-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a The peptides are administered to a patient. This is administered to
                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).
Cytotoxic T Lymphocyte; CTL; major histocompatibility complex; MHC; immuosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to abanch the patient for a limited period of time (comparad to Histerime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CLLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composine. Comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Example: Page 9; 29pp; English.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents HLA-B2702.60-84. These sequences can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-NOV-1996 (first entry)

CR 895413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the HAB38.6084. These sequences can be used to isolate the protein p74 from a T-cell lyate. P74 is a T-cell surface membrane protein massociated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSc70. P74 is found in a cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide.

Containing a covalently bound HIA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with HA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising them with the extracellular portion of p74 and determining the amount of binding between the candidate composition of CT activity can be inhibited in a celluar composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete companence of the p74 ligand.
amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.
Compositions comprising the extracellular fragment of p74 combined with this sequence, induces calcium influx, and inhibits cytochort T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing r-cells and antignen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               lysate; membrane protein; mammal; heat shock protein; Hsc70; APC; calcium influx; cytotoxic T lymphocyte; CTL; differentiation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HLA; p74; alphal-helix; human-leucocyte-associated antigen; inhibitor; T-cell lysate; membrane profesh; mamman.

Example 13; Page 32; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompetibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subcherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
HLA-B2702 CTL modulating peptide (B2702.60-84).
Cytockoic T lymphocyte; CTL; major histocompatibility complex; MHC;

The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytocoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and mooplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R41205 standard; peptide; 25 AA.

Clayberger C, Krensky AM, Parham P;

DR WP1: 95-358580746.

PT Clayberger C acceptance period of transplants from MHC unmatched of acceptance period of transplants from MHC unmatched of acceptance period of transplants from MHC unmatched of acceptance period of the alpha-1 domain of the recipient processon of acceptance corresponds to residues 60-84 of the alpha-1 domain of the class I MHC class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC class I major histocompatibility complex (MHC) antigens. The peptides are administered to a patient from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a current treatments). The peptides particularly modulate (or inhibit) the current treatments). The peptides particularly modulate (or inhibit) the cativity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                   ó
